1

- ☐ X.25 Overview
- ☐ X.25 Protocol Layers
- ☐ X.25 Physical Layer
- ☐ X.25 Frame Level: LAPB
- ☐ X.25 Packet Level
- ☐ Call Setup/Disconnection

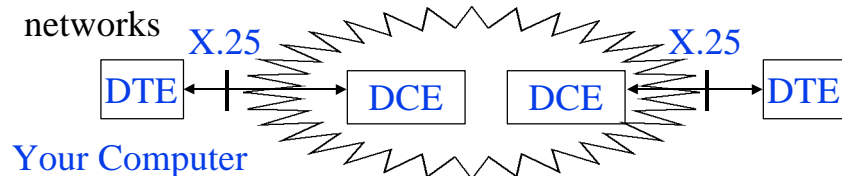

The Ohio State University

Raj Jain

2

X.25 Overview

- ❑ First packet switching interface.
- ❑ Issued in 1976 and revised in 1980, 1984, 1988, and 1992.
- ❑ Data Terminal Equipment (DTE) to Data Communication Equipment (DCE) interface
⇒ User to network interface (UNI)
- ❑ Used universally for interfacing to packet switched networks

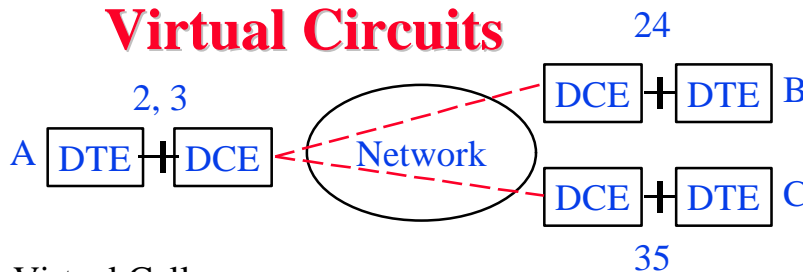

The Ohio State University

Raj Jain

3

Virtual Circuits

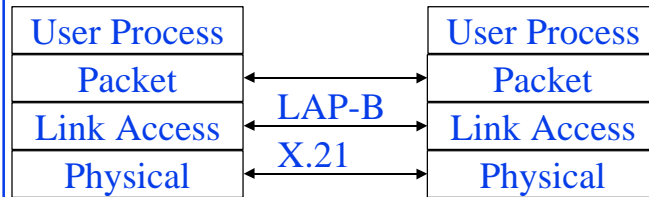

- ❑ Virtual Call
- ❑ Two Types of Virtual Circuits:
 - Switched virtual circuit (SVC)
Similar to phone call
 - Permanent virtual circuit (PVC)
Similar to leased lines
- ❑ Up to 4095 VCs on one X.25 interface

The Ohio State University

Raj Jain

4

X.25 Protocol Layers

DTE

DCE

- ❑ X.21 often replaced by EIA-232 (RS-232C)
- ❑ LAP-B = Link access procedure - Balanced
- ❑ Packet layer = Connection-oriented **transport** over virtual circuits

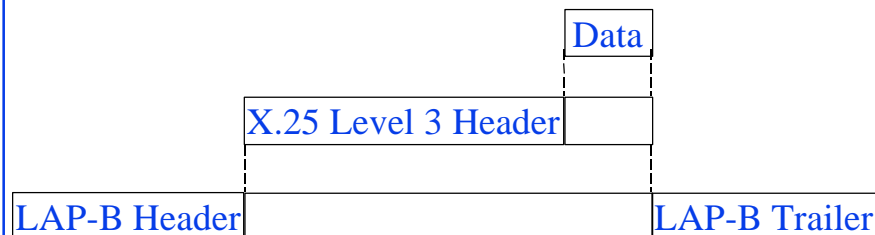

The Ohio State University

Raj Jain

5

Protocol Layers (Cont)

- ❑ X.25 Packets
- ❑ Data is broken into blocks
- ❑ 3- or 4-byte packet header
- ❑ Packets are broken into LAPB **frames**

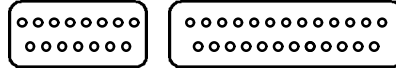

The Ohio State University

Raj Jain

6

X.25 Physical Layer

- ❑ Electrical and mechanical specifications of the interface
- ❑ X.21 = 15-pin digital recommendation
- ❑ X.21bis = X.21 twice = X.21 second
Interim analog specification to allow existing equipment to be upgraded.
Now more common than X.21 \Rightarrow X.21 Rev 2
- ❑ RS-232-C developed by Electronics Industries Association of America (EIA) is most common
Uses 25-pin connector. Commonly used in PCs.

Raj Jain

7

HDLC Family

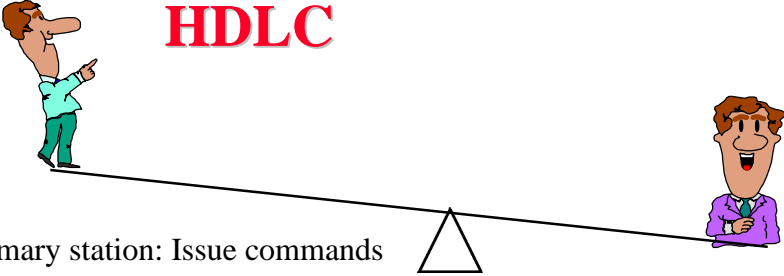

- ❑ Synchronous Data Link Control (SDLC): IBM
- ❑ High-Level Data Link Control (HDLC): ISO
- ❑ Link Access Procedure-Balanced (LAPB): X.25
- ❑ Link Access Procedure for the D channel (LAPD): ISDN
- ❑ Link Access Procedure for modems (LAPM): V.42
- ❑ Link Access Procedure for half-duplex links (LAPX): Teletex
- ❑ Point-to-Point Protocol (PPP): Internet
- ❑ Logical Link Control (LLC): IEEE
- ❑ Advanced Data Communications Control Procedures (ADCCP): ANSI
- ❑ V.120 and Frame relay also use HDLC

The Ohio State University

Raj Jain

8

HDLC

- ☐ Primary station: Issue commands
- ☐ Secondary Station: Issue responses
- ☐ Combined Station: Both primary and secondary
- ☐ Unbalanced Configuration: One or more secondary
- ☐ Balanced Configuration: Two combined station
- ☐ Normal Response Mode (NRM): Response from secondary
- ☐ Asynchronous Balanced Mode (ABM): Combined Station
- ☐ Asynchronous Response Mode (ARM): Secondary may respond before command

The Ohio State UniversityRaj Jain

9

LAPB

- ☐ Uses balanced mode subset of HDLC between DTE and DCE
- ☐ Uses 01111110 as frame delimiter
Uses bit stuffing to avoid delimiters inside the frames
- ☐ Uses HDLC frame format
- ☐ Point-to-point: Only two stations - DTE (A), DCE (B)
Addresses: A=00000011, B=00000001
Address = Destination Addresses in Commands
Source Address in Responses,

Flag	Address	Control	Info	FCS	Flag	Address
8b	8b	8 or 16b	nb	16b	8b	---

The Ohio State UniversityRaj Jain

10

Control Field Format

	1	2	3	4	5	6	7	8
Information	0	N(S)			P/F	N(R)		
Supervisory	1	0	S		P/F	N(R)		
Unnumbered	1	1	M		P/F	M		

- N(S) = Send Sequence Number
- N(R) = Receive Sequence Number = Expected next
- P/F = Poll/Final = Command/Response
- M = Set Async Balanced Mode (SABM), Disconnect, Unnumbered Ack, ...
- S = Supervisory function = Receiver Ready (RR), Receiver Not Ready (RNR), Reject (Rej)

The Ohio State University

Raj Jain

11

HDLC Frames

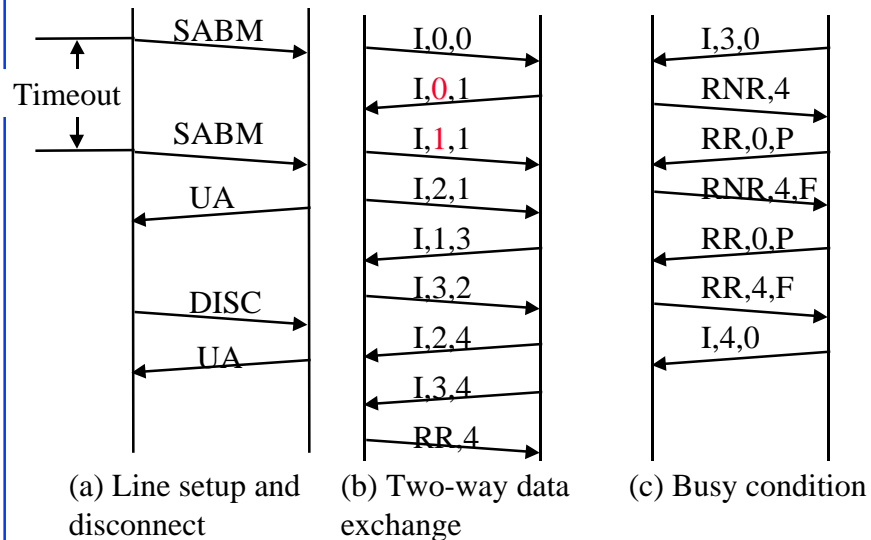

- Information Frames: User data
 - Piggybacked Acks: Next frame expected
 - Poll/Final = Command/Response
- Supervisory Frames: Flow and error control
 - Go back N and Selective Reject
 - Final \Rightarrow No more data to send
- Unnumbered Frames: Control
 - Mode setting commands and responses
 - Information transfer commands and responses
 - Recovery commands and responses
 - Miscellaneous commands and responses

X.25 Packet Level

- Packet Level = End-to-end
- Packet level procedures:
 - Establishment and clearing of virtual calls
 - Management of PVCs
 - Flow Control
 - Recovery from error conditions

Call Setup/Disconnection

Packet Format

4b	4b
General Format Identifier	Logical Channel Group #
Logical Channel Number	
Packet Type Identifier	

- ❑ GFI = Type of packet.
 - Bit 1: Qualifier. Q=1 \Rightarrow Higher level control
 - Bit 2: 0 \Rightarrow End-to-end confirm., 1 \Rightarrow Local conf.
 - Bits 3,4: 01 \Rightarrow 3-bit or 10 \Rightarrow 7-bit sequence #
- ❑ LCGN + LCN = 12-bit VC # w 4-bit Group
- ❑ PTI = 20 possible packet types

Packet Format (Cont)

Q	D	0	1	Group #
Channel #				
P(R)	M	P(S)	0	
User Data				

Data w 3-bit Seq #

Q	D	1	0	Group #
Channel #				
P(S)				0
P(R)				M
User Data				

Data w 7-bit Seq #

- q M = More segments
- q P(R) and P(S) refer to packet sequence #
Different from N(R) and N(S) - frame sequence #

Packet Format (Contd)

0	0	0	1	Group #
Channel #				
Packet Type				1
Additional Info				
Control w 3-bit Seq #				

0	0	0	1	Group #
Channel #				
P(R)		Pkt Type		1

RR, RNR, and REJ
packets with 3-bit seq #

The Ohio State University

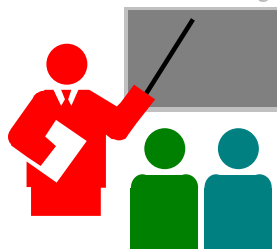

0	0	1	0	Group #
Channel #				
Packet Type				1
Additional Info				
Control w 7-bit Seq #				

0	0	1	0	Group #
Channel #				
Pkt Type				1
P(R)				0

RR, RNR, and REJ
packets with 7-bit seq #

Raj Jain

Summary

- ☐ X.21, LAPB
- ☐ PVC and virtual call
- ☐ VC numbers
- ☐ M and D bits

Homework

- ❑ Read pages 61-65 of Black's "Emerging Technologies" book
- ❑ Submit answer to the following question:
In X.25 why is the VC number used by one station is different from the VC number used by the other station? After all, it is the same full-duplex virtual circuit.
- ❑ Due Date: April 13, 1999
